Funciones

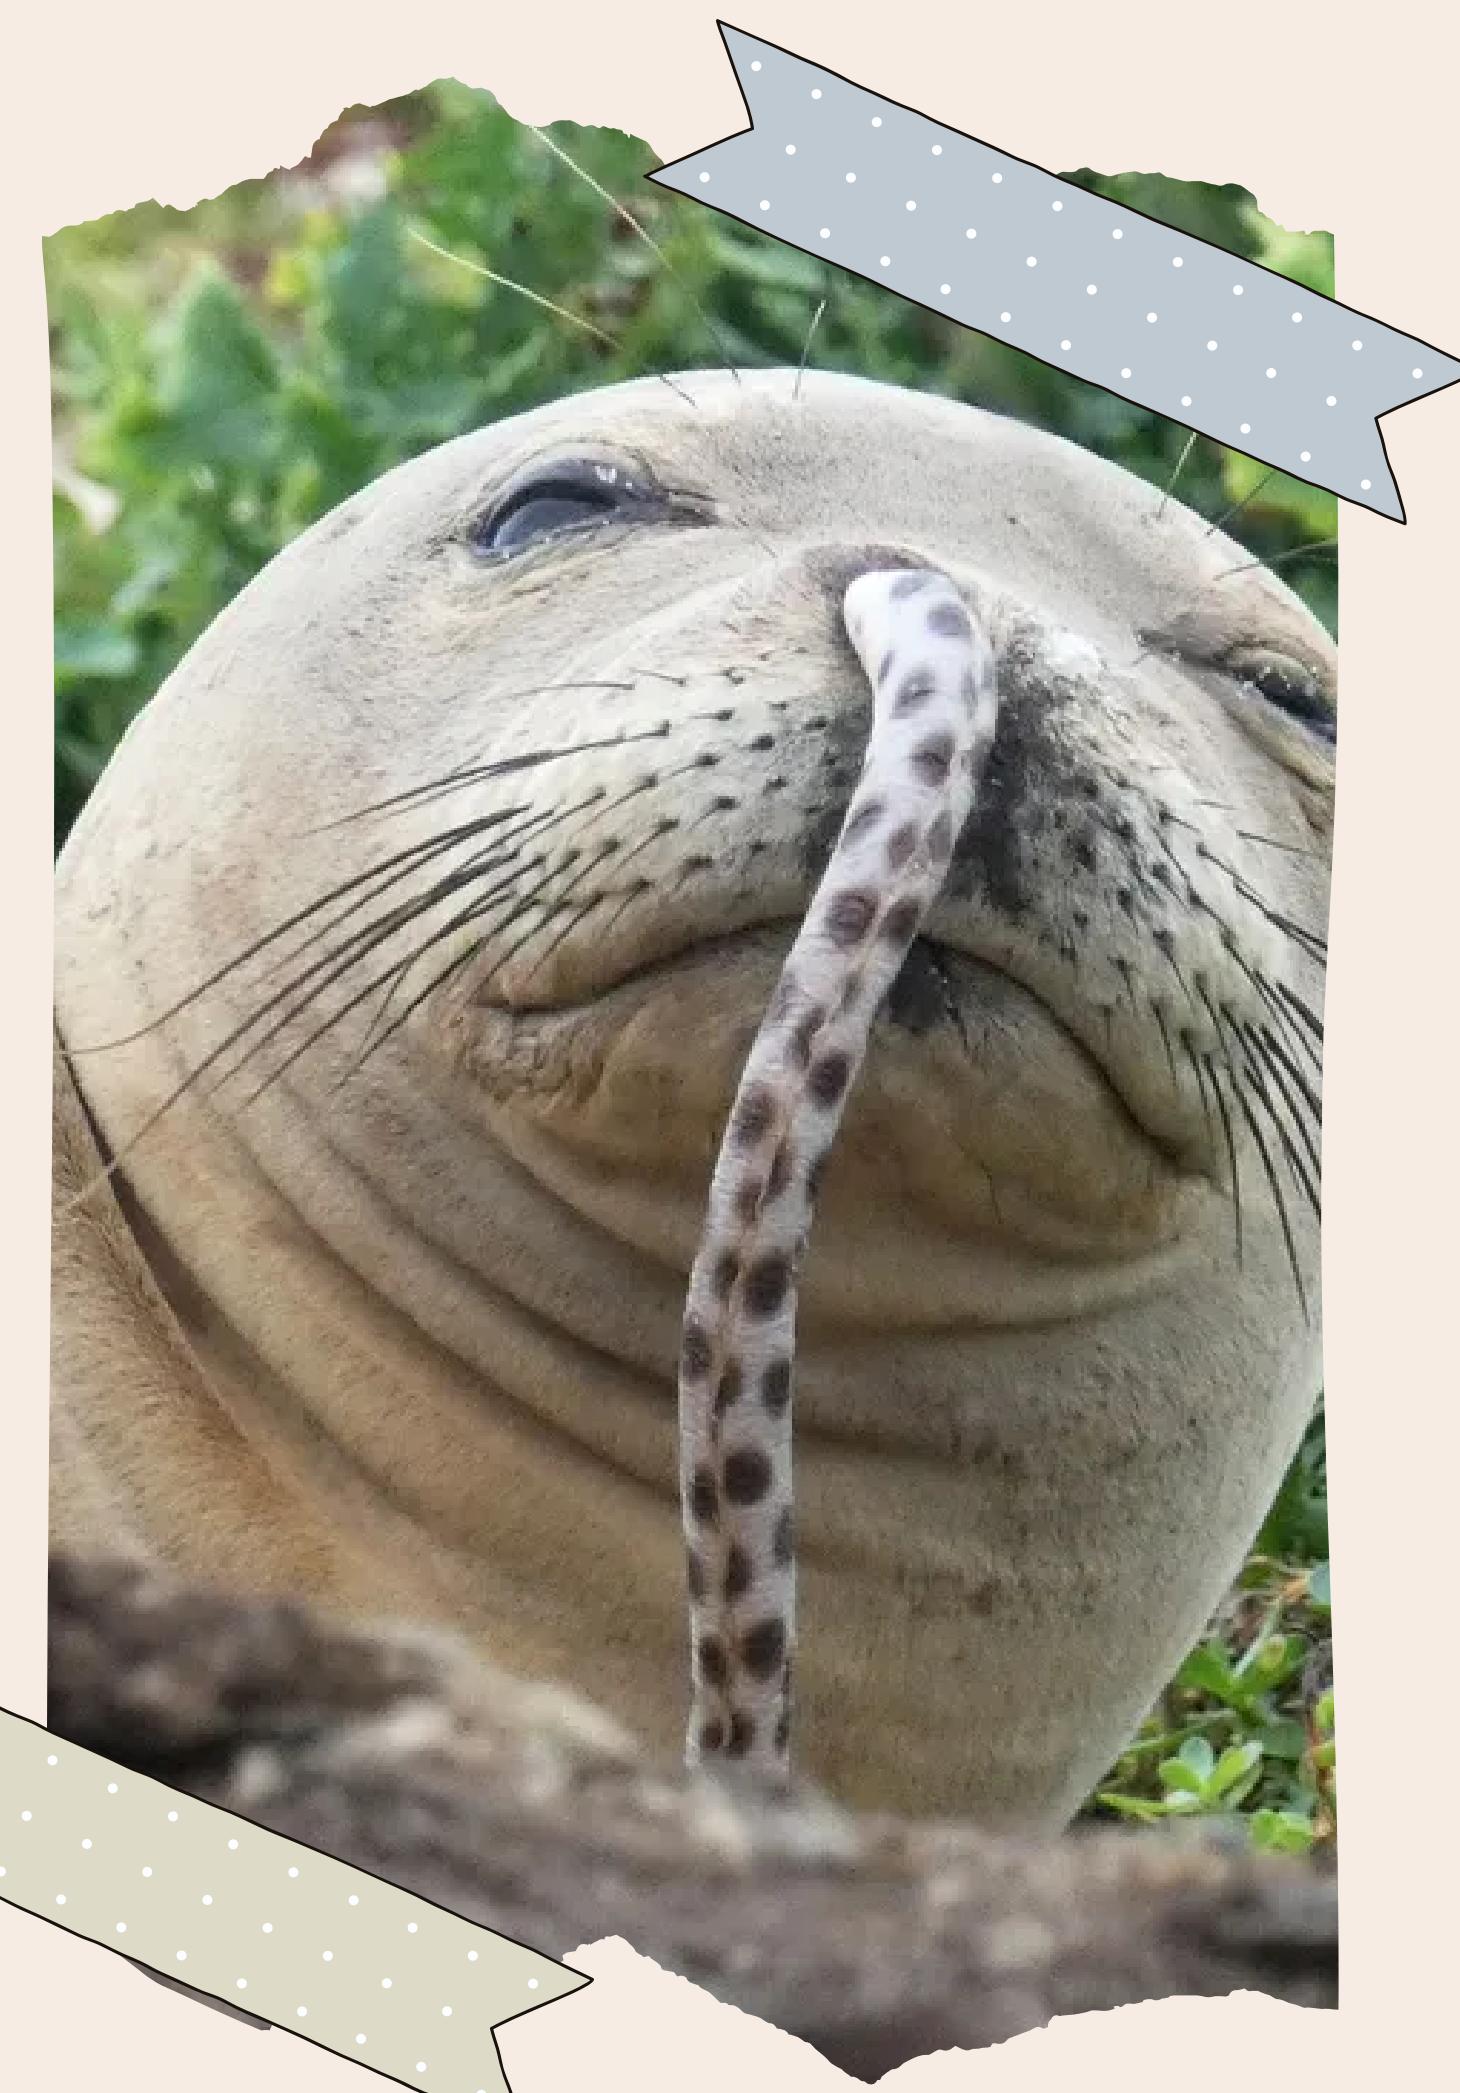

Desafío

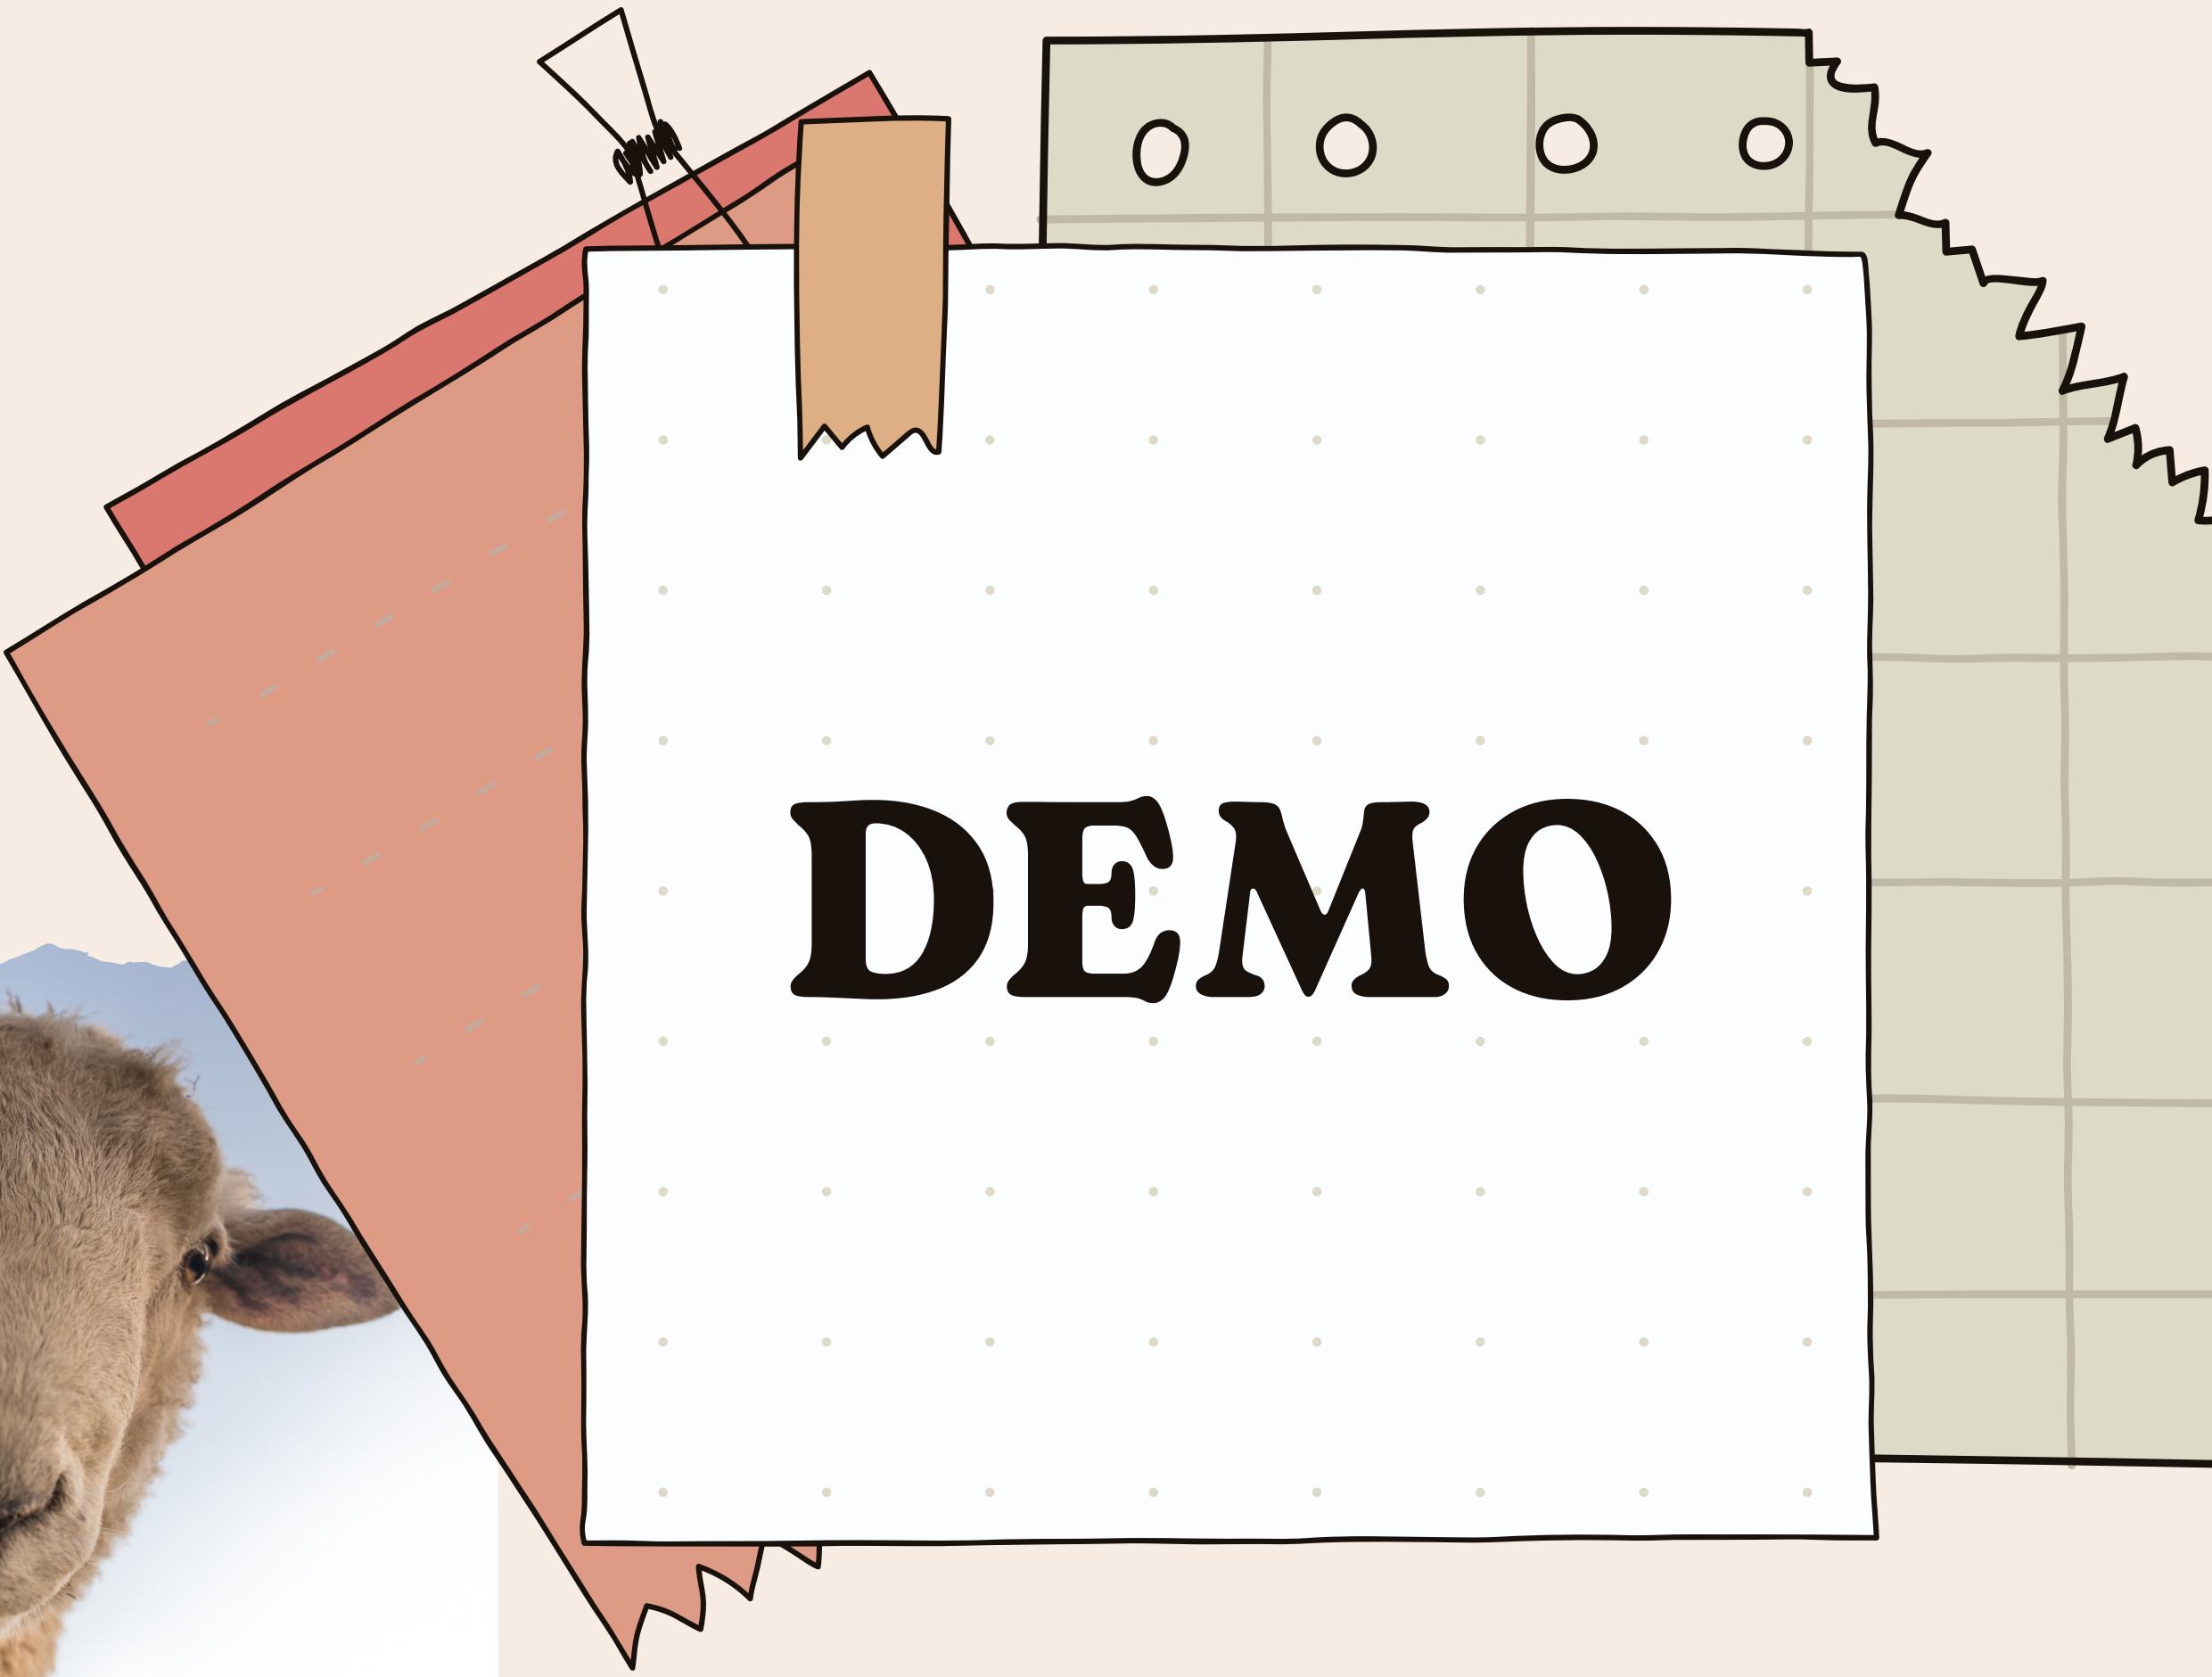

Transformar un archivo de texto en formato de markdown en un archivo html que se vea lo más parecido posible

Supuestos

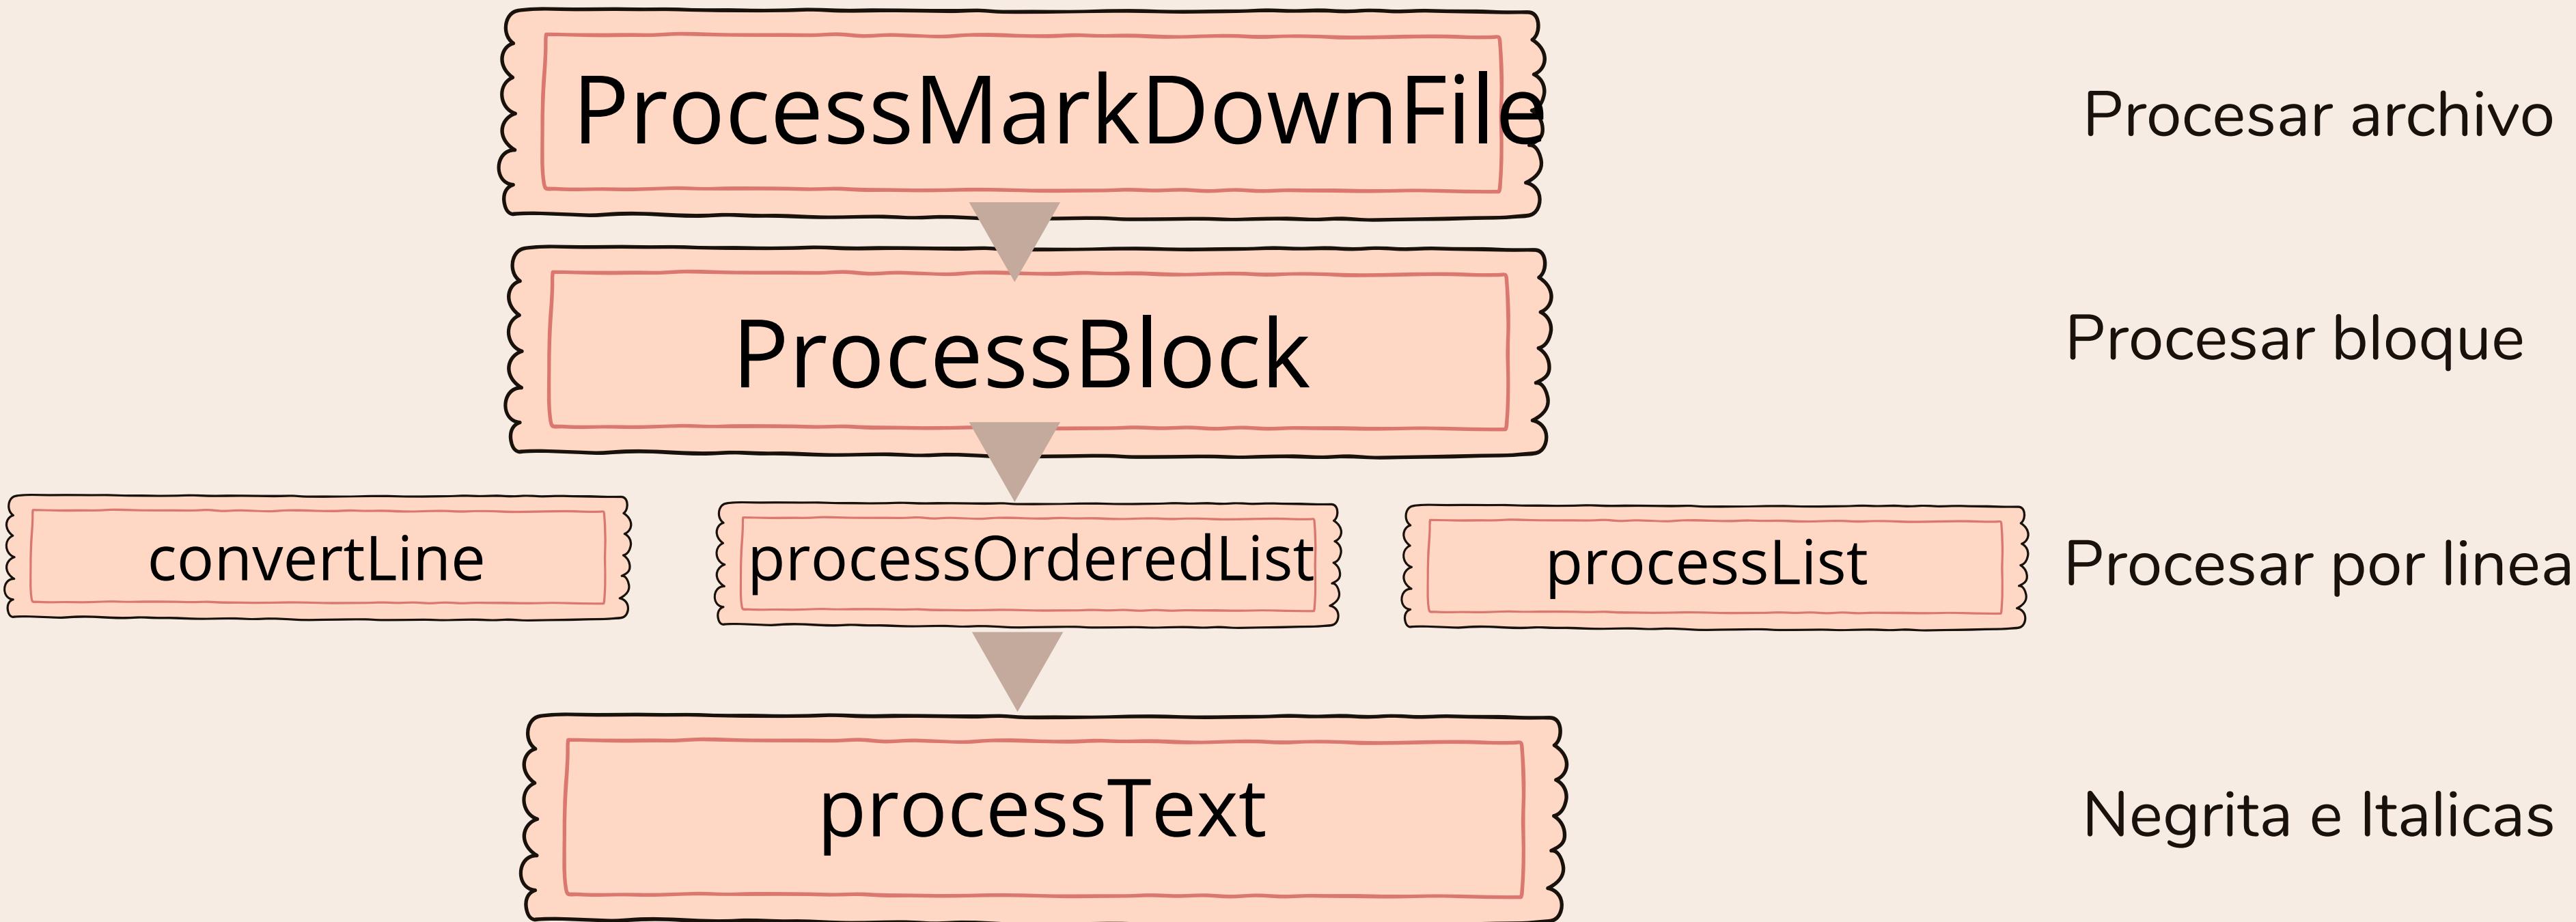

- Un párrafo se escribe en una sola línea.
- Buenas prácticas de MarkDown
- Recibe archivo de texto md

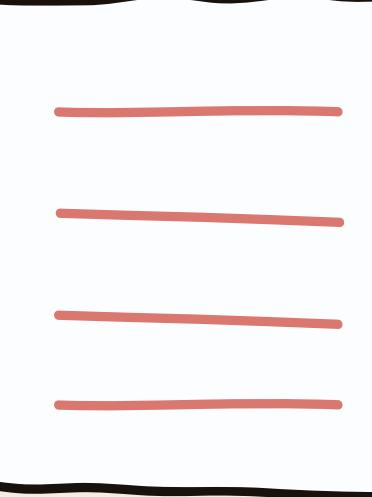

DEMO

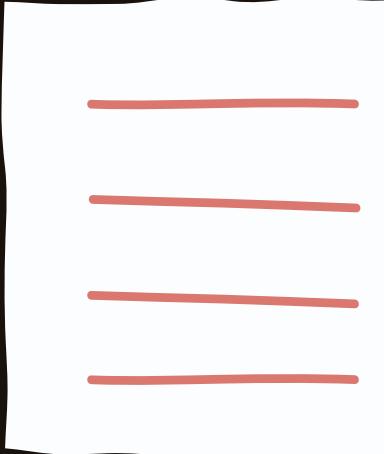

Flujo

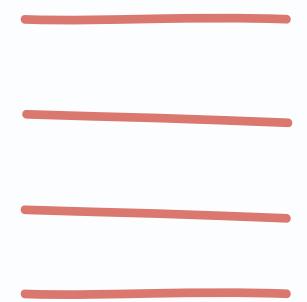

Separar Markdown

```
4  export function ProcessMarkdownFile(markdownFilePath, outputFileName="result"){
5      const content = readFileSync(markdownFilePath, {encoding:'utf8', flag:'r'});
6      const contentByBlocks = content
7          .split('\n\n')
8          .map((l) =>l.split("\n"))
9          .filter(n => JSON.stringify(n) !== '[""]' )
10         .map(block => block.filter(line => line));
11      const htmlFileContent = contentByBlocks
12          .map(block => processBlock(block))
13          .map(htmlBlock => htmlBlock.join(""))
14          .join("");
15      writeFile(`output/${outputFileName}.html`,htmlFileContent , (err) => {
16          if (err) throw err;
17      })
18      return console.log(`File successfully saved at output/${outputFileName}.html`)
19  };
20
```

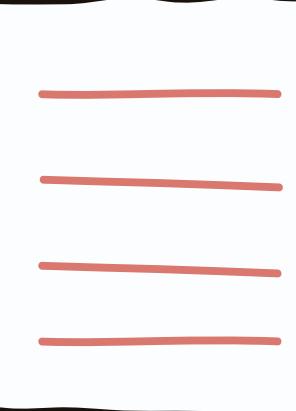

Procesar Bloque

```
49 // Funcion para procesar un bloque
50 export function processBlock(lines) {
51   if (lines[0].trim().split(" ")[0] === "*") {
52     //procesar lista
53     return processList(lines);
54   }
55   else if (lines[0].trim().split(" ")[0] === "1.") {
56     //procesar lista ordenada
57     return processOrderedList(lines);
58   }
59   else {
60     //procesar lineas
61     return lines.map(line => convertLine(line));
62   }
63 };
```

Procesar Lista

```
31 //Funcion para procesar una lista
32 ✕ const processList = (lines) => {
33   ✕   const listLines = lines.map(line => {
34     |     return processText(line.replace('* ', '^<li>^') + '</li>\n');
35   });
36   const result = ["<ul>\n"].concat(listLines).concat(["</ul>\n"]);
37   return result;
38 };
```

Procesar Lista Ordenada

```
40 //Funcion para procesar una lista ordenada
41 ↴ const processOrderedList = (lines) => {
42   ↴   const listLines = lines.map((value,index) => {
43     |   return processText(value.replace(`#${index+1}. `, `<li>`)) + '</li>\n';
44   });
45   const result = ["<ol>\n"].concat(listLines).concat(["</ol>\n"]);
46   return result;
47 };
48
```

Procesar Lineas

```
3 // Función por linea (recibe una linea y devuelve una linea)
4 const convertLine = (line) => {
5     // Linea horizontal
6     if (line.match(/^\---$/)) {
7         return '<hr>\n';
8     }
9     const proccesedLine = processText(line);
10    const firstChar = proccesedLine.split(" ")[0];
11    if (countHashtags(firstChar) === firstChar.length){
12        return `<h${firstChar.length}>${proccesedLine.slice(firstChar.length+1)}</h${firstChar.length}>\n`;
13    }
14    else{
15        return `<p>${proccesedLine}</p>\n`;
16    }
17};
18
19 //Funcion para contar #
20 const countHashtags = (str) => _.countBy(str)[="#"] || 0;
```

arr.slice([inicio [, fin]])

Lodash
.countBy

Procesar Texto

Negrita: __(.*)__

(.)**

Itálica: _(.*)_

(.)*

```
22 //Funcion para procesar texto, reemplazando negrita y italica
23 const processText = (text) => {
24   return text
25   .replace(/\*\*(.*)\*\*/g, '<strong>$1</strong>')
26   .replace(/__(.*)__/g, '<strong>$1</strong>')
27   .replace(/\*(.*)\*/g, '<em>$1</em>')
28   .replace(/_(.*)_/g, '<em>$1</em>');
29 }
```

RegEx

g: global

(.*): anything
